TurningPoint, clickers and receivers

TurningPoint is response technology used for interactive presentations in the classroom. It consists of a local application, a “USB receiver” and a remote “clicker.” (Smartphones may also be used as clickers)

Useful Instructions:

For the clickers to communicate with a PC:
1. The computer must have both the TurningPoint installed and have a current receiver.
2. The receiver is often fastened with Velcro to the back of the monitor. Detach it and plug it into the USB on the side of the monitor.
3. When presenting your TurningPoint session, there is a ResponseWare selection tool in the software that creates a session number for those with mobile devices to enter on their devices.

Common Questions:
- What is the correct receiver?
  ○ Model number RRRF - 02 updated to firmware version 4.7.
- How do you enable smartphones?
  ○ Contact your college’s Applied Technology Consultant to request access for your class.
